Online Job Portal System

Introduction

The **Online Job Portal** connects employers and job seekers on one platform.

Candidates can create profiles, search for jobs, and apply online.

Employers can post job openings and manage applications.

It makes the recruitment process faster and easier.

Developed using **Node.js, Express.js, and MongoDB**.

Objectives

1. Simplify recruitment workflows and centralize job listings.
2. Improve candidate-employer matching, reduce time-to-hire, and ensure a secure, responsive platform using modern web technologies.

Hardware Specs

- Processor: Intel Core i3 or higher
- RAM: Minimum 4 GB
- Hard Disk: At least 20 GB free space

Software Specs

Operating System: Windows

Backend: Node.js Database: MongoDB

Frontend: HTML, CSS, JavaScript

Code Editor: Visual Studio Code.

Functional Needs

Core features:

- User Registration, Job Posting, job search, application submission.
- Employers manage listings and view candidate applications through dashboards.

Non-Functional Needs

- Provide **easy navigation and compatibility** across different browsers and devices.
- Maintain **backup, recovery, and scalability** to support system growth.

- Ensure **high system availability and data privacy** to protect user information.

Conclusion

The Online Job Portal System connects job seekers and employers on one platform.
It allows employers to post jobs and candidates to search and apply easily.
The system makes the recruitment process faster and more convenient.
It is developed using Node.js, Express.js, and MongoDB for efficient performance.
